

Rotary delimber

Intended to be installed before the washer,
 The Rotary delimber allows for separation
 the branches of the nuts that pass between
 rotating shafts.

Particularly robust, it allows
 to break up the bundles of leaves and
 clods of earth.

It comes standard with a small
 lower hopper to be mounted and protection on
 the outlet side of the branches

(not listed on the diagram opposite)

The separator can be supplied as an option
 with feet to be determined according to
 of its implementation.
